

# Finally! Monitoring Moodle with `tool_monitoring`

Daniel Fainberg

Martin Gauk

Sebastian Rupp

Malte Schmitz

Melanie Treitinger

# Why monitoring with `tool_monitoring`?

Know what is happening on your Moodle site:

- See what your **users** are doing
- Know about **errors** before your users do
- Identify bottlenecks and improve **performance**

💪 **tool\_monitoring** provides a generic API for arbitrary monitoring tools, where they can define and collect metrics about the Moodle instance.

# What can we monitor with `tool_monitoring`?

- ✓ Already provides a set of sensible metrics.
- 👉 *Other plugins can also provide their own metrics!*

Examples:

- Number of registered/active/mobile **users, courses**
- Number of adhoc/scheduled/failed **tasks**
- Number of files/draft **files**
- Number of active **quiz attempts**
- Number of **assignments** which have not been submitted
- AI usage ...

# Components of `tool_monitoring`

## Hook API

The plugin defines a **hook** which collects the available metrics (pre-defined & from other plugins).

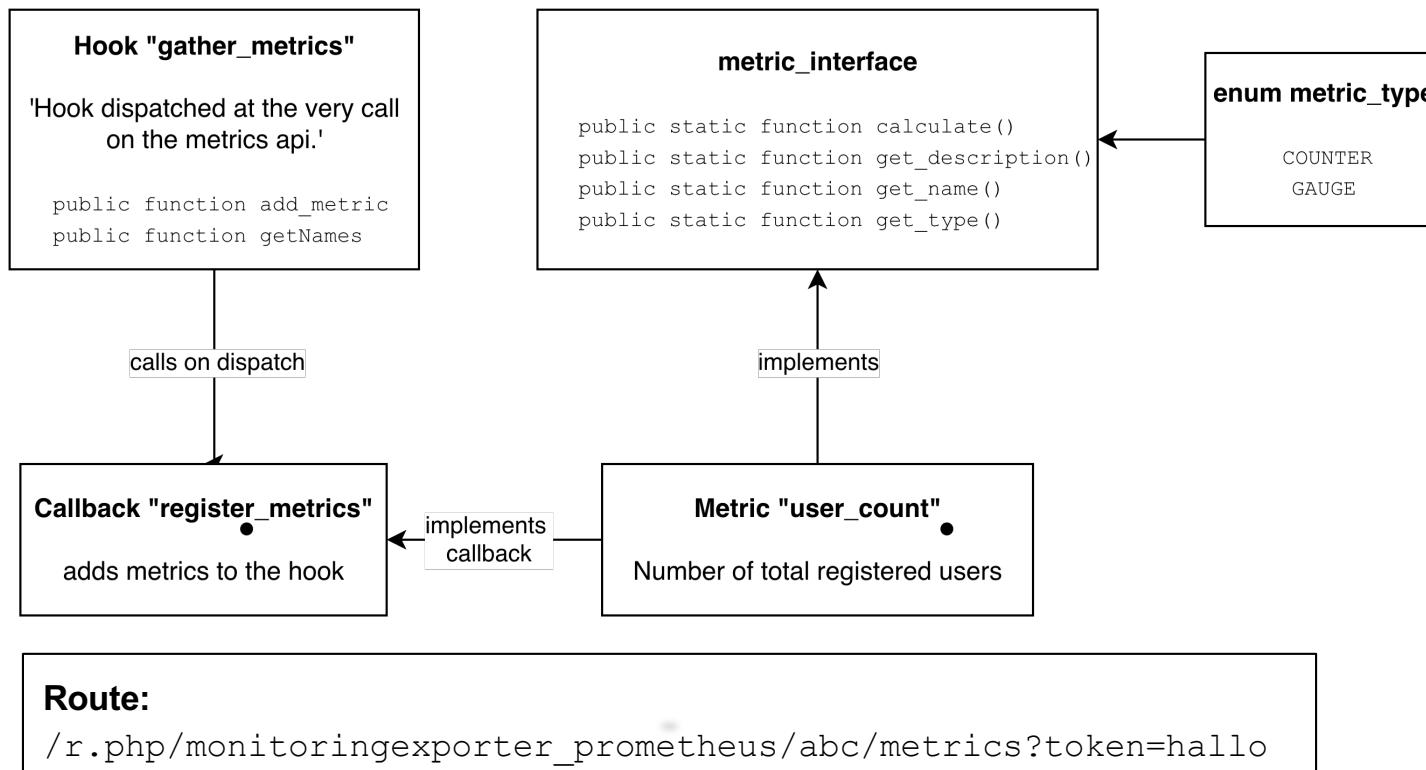

## Interface

The plugin defines a common interface for all metrics with the functions name, description, type, calculate.

## Endpoint for Prometheus (*others via subplugins*)

The endpoint is created with the new routing API and secured by a token.

# Components of tool\_monitoring

# Try it yourself!
